SQL Replication

- > Replication Strategies
- > Evaluated Technologies
- Enhydra Octopus:
 - > Architecture
 - > Setup
 - Experience in Atlas:
 - ➤ GeometryDB: Oracle -> MySQL
 - ConditionsDB: MySQL -> MySQL

J.Hrivnac (LAL) for DDD WS, Dec'04 in CERN

Replication Ways

- ➤ Native Tools (Oracle, MySQL,...)
- Figeneric Converters (Octopus,...)
- > Actual Applications (JDBC-based, Pool/RAL-based)

Replication Use Cases

- Replication within technology (MySQL->MySQL,...):
 - Native Tools are fast and sure
 - Generic Converters provide unified API
- Replication between technologies (Oracle->MySQL,...):
 - If same Schema in both technologies: Generic Tools do well
 - ➤ If almost same Schema in both technologies: Generic Tools can be configured with customized mapping (using configuration files or special plugins)
 - If different Schema in both technologies or data have to be modified: Actual Applications is usually the best choice

Evaluated Technologies

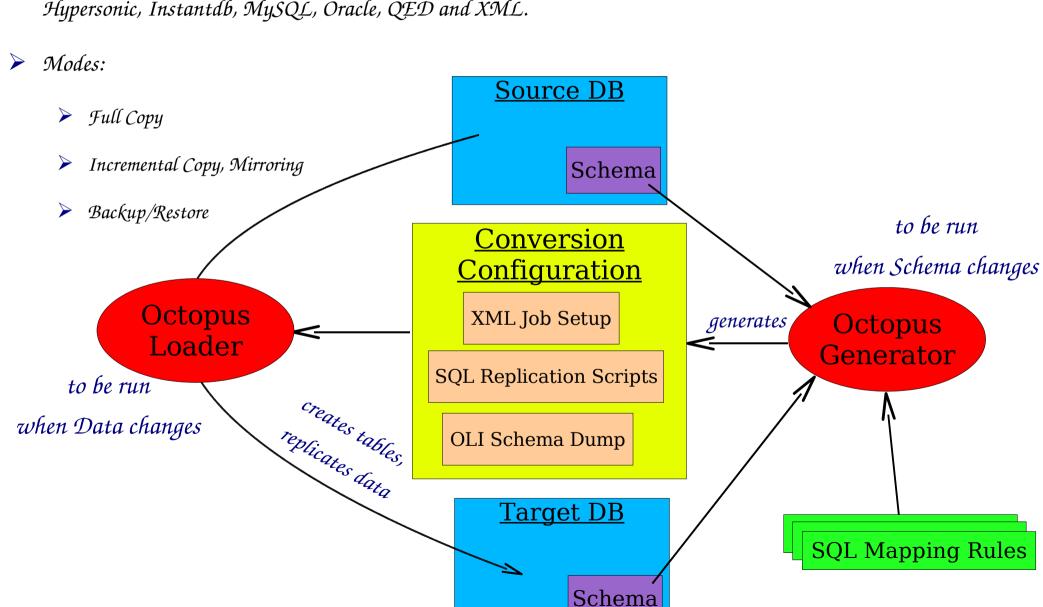

(for the heterogeneous replication)

- SQLTuple/ColMan (AIDA NTuple API for SQL databases): good for AttributeList/NTuple or similar mapping
 - Is able to filter and merge while replicating Pool AttributeList on MySQL, Oracle, PostgreSQL and McKoi
- Figure 12 Groovy-based Replicator: learning tool, simple, easy, basic
- > <u>IDBC</u> Importer: a bit different mission, needs a lot of customizations
- Enhydra Octopus: seems to be the best match
 - > Replicates (set of) tables keeping all constrains (keys, indexes,...)

Octopus Architecture

Support for Access, DB2, MSQL, Paradox, CJDBC, Excel, Informix, McKoi, PostgreSQL, Sybase, CSV, Hypersonic, Instantdb, MySQL, Oracle, QED and XML.

Octopus Setup

- ➤ Ant <u>build.xml</u> file
- Run description build.properties file
- Customised mapping <u>map.properties</u> file (designed to satisfy special Atlas requirements)

Clean everything ant clean

Generate replication scripts ant generate

Perform the replication ant load

Recompile Atlas customizations ant patch

Get help ant -projecthelp Src.Db=@sundb07.cern.ch:1521:pdb01-1

Src.User=atlasdd

Src.Passwd=bla

Src.Schema=ATLASDD

Dest.Db=atlasdbdev.cern.ch:3306/CollectionTest

Dest.User=CollTester

Dest.Passwd=bla

Log.Mode=full

Tables=ALIN DATA; ALIN DATA2TAG

octopus.mysql.varchar2(4000).type=varchar octopus.mysql.varchar2(4000).length=255

octopus.mysql.float(126).type=double

octopus.mysql.float(63).type=float

octopus.mysql.number(1).type=tinyint octopus.mysql.number(1).length=1

octopus.mysql.number(10).type=integer octopus.mysql.number(10).length=10

GeometryDB Replication

- ➤ Oracle->MySQL
- Fixed problems:
 - Support for Oracle/varchar2 to MySQL/varchar, etc.: The requirement is to convert Oracle/varchar2 into MySQL/varchar. The problem is that Atlas GeomeryDB contains varchar2(4000), while MySQL allows the longest varchar(255). Standard Octopus doesn't support that (of course). This is now supported by Atlas Patch to Octopus via map.properties file. Note, that those user-supplied rules can be highly unsecure.
 - Support for replication of all tables belonging to an Oracle Schema: This was a missing feature in Octopus (Octopus could replicate either the whole server or just an explicit list of tables). It has been implemented and fed back to Octopus developers.
 - Unique Index on multiple columns: This was a bug of Octopus. It has been fixed.

Conditions DB Replication

- ➤ MySQL->MySQL
- Fixed problems:
 - MySQL tables contain a Primary Index with the name "PRIMARY": While some MySQL commands accept that, it is not generally supported as MySQL identifier because "PRIMARY" is a MySQL reserved word. Atlas Octopus Patch now creates commands which accept "PRIMARY" as a Primary Index name. Note, that using reserved words as Identifiers is a bug in a Database design.

<u>Documentation</u>

- Enhydra Octopus is provided by <u>ObjectWeb</u> Consortium, released under GPL, it has active user base and responsive developers.
- Reusable Atlas-motivated fixes and modifications fed back to Octopus developers to will be included in the distribution.
- Doctopus has already helped us to find bugs in our SQL Schemas.
