

Secondary Tables (legacy)

- Status
- TOverlap, TStat, DOverlap
- Web Service

Status (1)

- Emil has copied original secondary tables to analytix (thanks)
 - `/user/atlevind/TOverlap`: trigger overlaps
 - `/user/atlevind/TStat`: trigger statistics
 - `/user/atlevind/DOverlap`: dataset overlaps
- Accessible:
 - Directly from HDFS (as map files)
 - Via CLI in CERN as
`curl 'http://aiatlas073.cern.ch/Atlascope.ReadHDFS.jsp'`
 - Via WS everywhere as
`https://atlas-event-index.cern.ch/Atlascope/ReadHDFS.jsp`
- Can be used till new tables created (or even to fill the initial data in the new structure)
 - A lot of CPU needed to create especially TOverlaps

TOverlap

events sampling method - mostly @S1000

number of all events - exact

dataset name (re-arranged)

```
$ curl 'http://aiatlas073.cern.ch/Atlascope/ReadHDFS.jsp?fn=/user/atlevind/TOverlap/EI18.1/data18_hi.physics_UPC_merge.AOD_f1028_m2055.00367023@S1000'  
EVT: 8296000  
HLT_beamspot_activeTE_trkfast_peb: 124440  
HLT_beamspot_activeTE_trkfast_peb_L1J12_VTE200: 182512  
...  
OVL:HLT_beamspot_activeTE_trkfast_peb:HLT_g28_etcut_ion: 8296  
OVL:HLT_beamspot_activeTE_trkfast_peb:HLT_g30_loose_ion: 8296  
...
```

number of trigger events - like in TStat, but may be approximative

number of trigger overlap events - may be approximative

very expensive to re-create

TStat

selection of triggers (= arguments of creating ti command) - mostly @00

number of all events - exact

dataset name (re-arranged)

```
$ curl 'http://aiaatlas073.cern.ch/Atlascope/ReadHDFS.jsp?fn=/user/atlevind/TStat/EI18.1/data18_hi.physics_UPC_merge.AOD.f1028_m2055.0036/023@00'  
EVT: 8296584.0  
HLT_2e20_loose_ion: 21.0  
HLT_2mu14: 35.0  
...
```

number of trigger events - exact

easy and fast to re-create

DOverlap

run number

number of overlap events (intersection) - exact

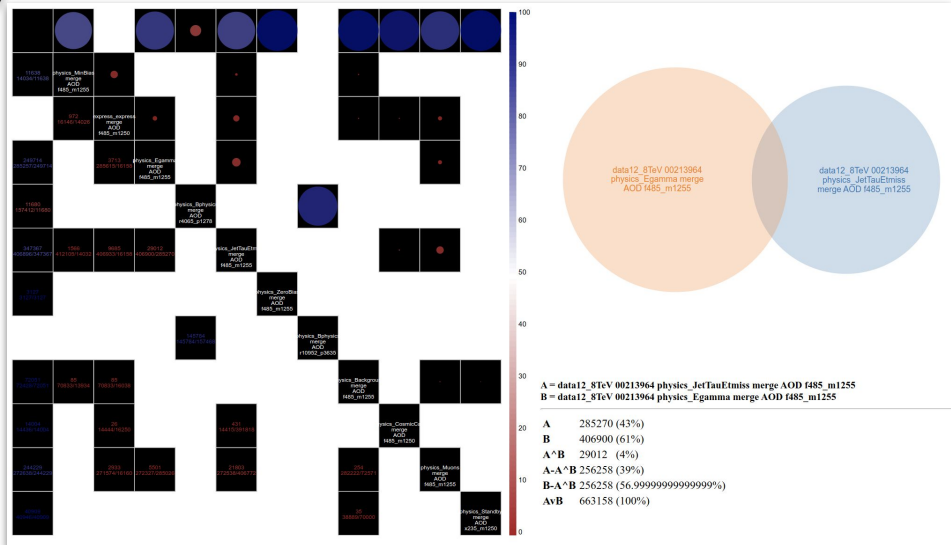

```
$ curl 'http://aiatlas073.cern.ch/Atlascope/ReadHDFS.jsp?fn=/user/atlevind/DOverlap/EI18.1/00348835'
...
data18_13TeV.00348835.physics_Main.merge.AOD.f937_m1972-data18_13TeV.00348835.physics_Main.merge.AOD.f921_m1947:      1063,100.00,100.00
data18_13TeV.00348835.physics_Main.merge.AOD.f921_m1947-data18_13TeV.00348835.express_express.merge.AOD.f921_m1947:  262,24.65,53.36

data18_13TeV.00348835.physics_CosmicCalo.merge.AOD.f921_m1947-none:      13549,99.96,100.00
...
```

datasets parts in overlap [%] - rounded, but can be fixed from Phoenix database

quite easy to re-create

Web Service

- **&view=html** to get view formatted for browser ([example](#))
- **&view=toverlap** to get correlogram and Venn diagrams for TOverlap
- **&view=doverlap** to get correlogram and Venn diagrams for DOverlap ([example](#))
- **&view=doverlap&fix=true** to get correlogram and Venn diagrams for DOverlap
 - and to correct dataset events from Phoenix (may be slow)
- A bit awkward for big tables (especially TOverlaps)

Status (2)

- Copied secondary tables are not perfect
 - They depend on information from Catalog, which doesn't exist any more
 - But that dependency may be partly replaced with dependency on new database
 - They are just a snapshot created when the system has been switched off
 - That could be fixed by the system, which doesn't exist yet
- They can be used till new system is in place
- Their content can be copied into new system as its initial content
- Maybe the logic (structure) can be re-used
 - The secondary data consist of small tables, so files in a filesystem may be a reasonable implementation
