

AstroLabNet

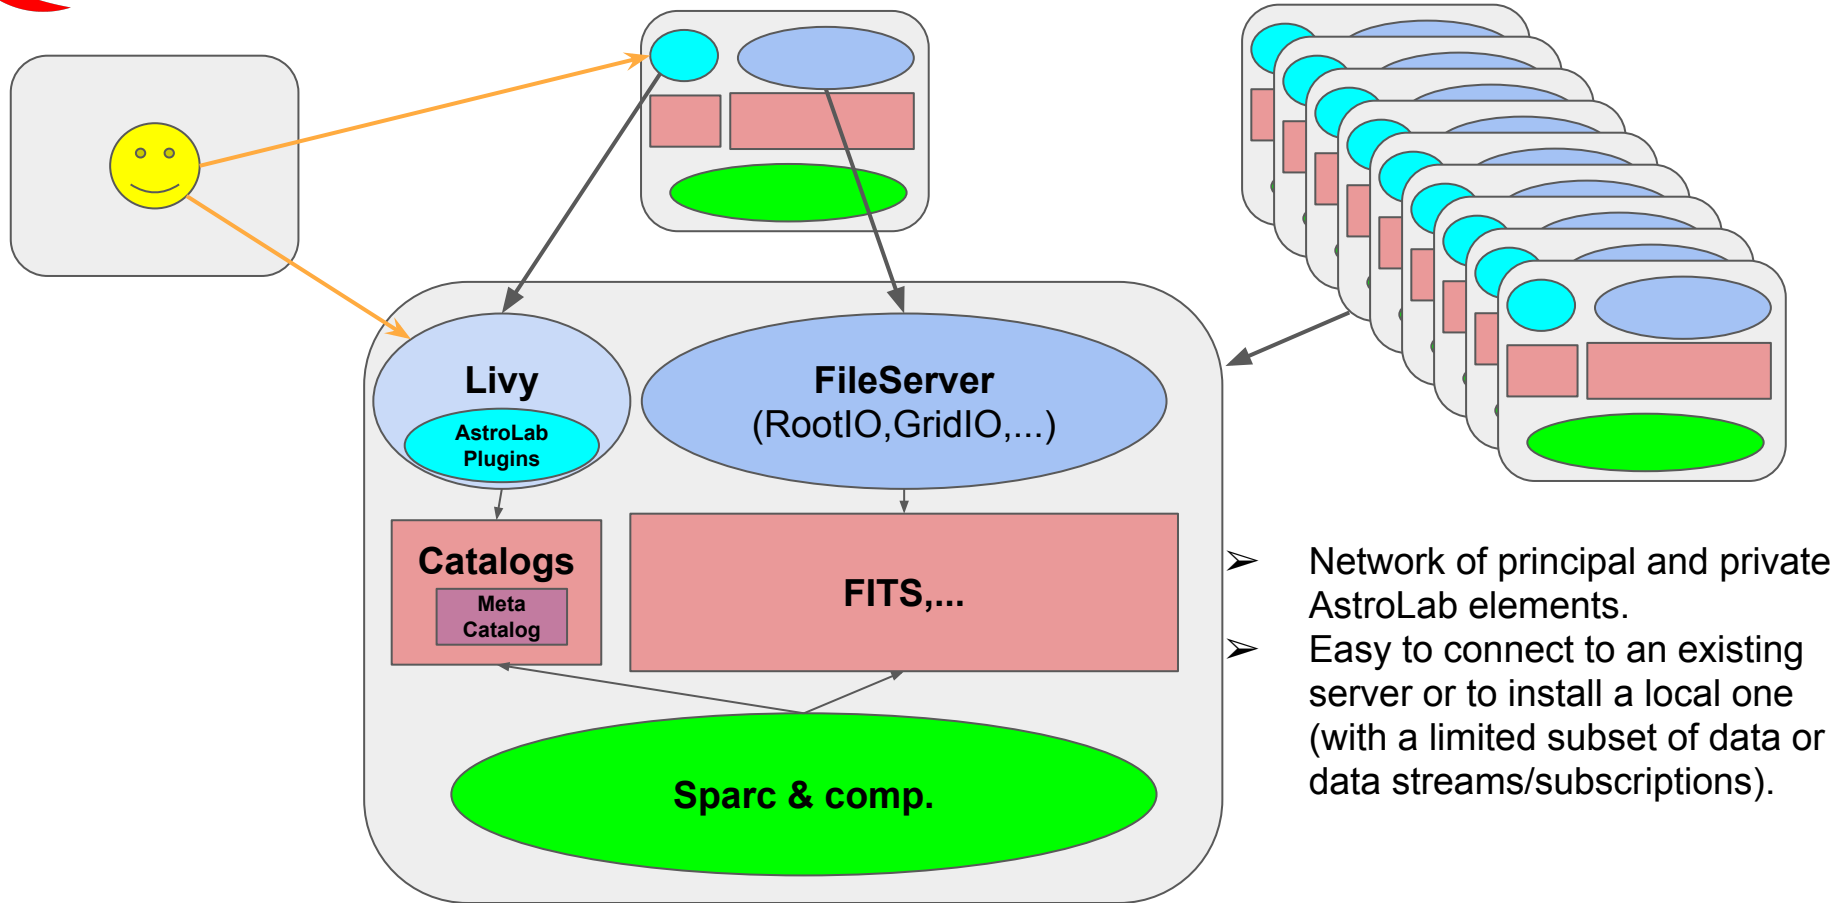

*Preliminary Ideas
for discussion*

How to give everyone the AstroLab functionality !

- **AstroLab Archipel Architecture**
- **Apache LIVY**
- **What about others ?**

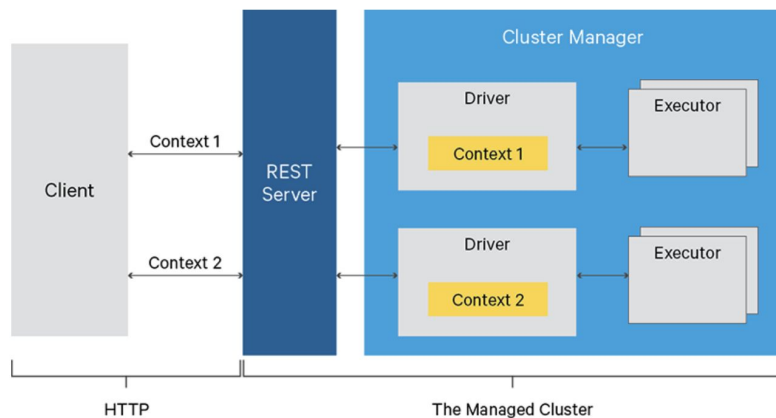

AstroLab Archipel Architecture

Apache LIVY

No modification needed on the cluster
(except for the security).

Apache Livy is a service that enables easy interaction with a Spark cluster over a REST interface. It enables easy submission of Spark jobs or snippets of Spark code, synchronous or asynchronous result retrieval, as well as Spark Context management, all via a simple REST interface or an RPC client library. Apache Livy also simplifies the interaction between Spark and application servers, thus enabling the use of Spark for interactive web/mobile applications.

+ Caching, MultiContext, Security,....

Risk: Apache LIVY is quite mature and under active development, but still under 'incubating' status.

Fallback: It would be possible to develop/maintain something like LIVY ourselves (which was my original idea anyway).

AstroLab Island

- Part of **AstroLab Archipel**.
- Simple use:
 - JS or CLI access without any local installation.
- Advanced use:
 - Full local AstroLab installation.
 - Subset of data (full MetaCatalog).
 - Requests/job can
 - be send to other servers
 - schedule data replication and local execution
- The same GUI/API for both usage patterns.
- Specific AstroLab plugins for LIVY or to make LIVY a plugin of something else (Guy ?).
- Data replicated lazily using other protocol (XRootIO, GridIO, HTTP,...).
- Possibility for replication subscription - streaming (i.e. to get all new data with some characteristics as they appear).

AstroLab & Others

- To provide effective data replication
 - We need a coherent architecture of an AstroLab island
 - Do we have anything ? Document ? Prototype ?
- What is the goal of the AstroLab, after all ?
 - To integrate with the mainstream framework
 - Or to develop an alternative ?
